

Handbook

Setup guide:

After downloading and unzipping the folder, do the following steps

The commands to start with For backend:

```
cd root/project/backend  
python -m venv .venv  
source .venv/bin/activate  
pip install --upgrade pip  
pip install -r requirements.txt
```

Starting the backend:

```
uvicorn main:app --host 0.0.0.0 --port 8000 --reload
```

For frontend:

```
brew install nvm  
brew install watchman  
npm install -g expo-cli  
cd root/project/frontend  
npm install
```

For running the frontend:

```
npx expo start
```

To Run from the docker:(all the necessary files are already there)

1. Download docker
2. Upgrade to the latest version
3. Be on the /root of the folder and run “docker compose up –build”
